

Security risk assessment report

Part 1: Select up to three hardening tools and methods to implement

Password policies, Firewall maintenance, Multifactor authentication (MFA)

Part 2: Explain your recommendations

Password policies should be implemented because all employees share a password, which makes it easier for an attacker to access an account. Another tool that can be added is firewall maintenance because there are currently no rules in place to filter traffic coming in or out of the network and it can help prevent DDoS attacks. Finally, a Multifactor authentication tool needs to be implemented to protect against brute force attacks since one isn't being used now.
